EXPERIENCE

Software Engineer @ Volkswagen Group of America
Contract via Artech | October 2022 - December 2025 | Belmont, CA

- Built an end-to-end auth stack integrating company single sign-on and role-based access control, injecting role claims into JWTs and enforcing least-privilege, role-scoped access in AWS Lambda workflows with corresponding client resource guards.
- Maintained cron-scheduled serverless pipelines where fetcher Lambdas ingest telemetry and publish documents to SQS for OpenSearch indexing, while an aggregator enriches indices and bulk-writes curated datasets.
- Modernized a Lambda-per-endpoint API into a single FastAPI service using router modularization, standardizing request/response models with Pydantic and auto-generating OpenAPI docs to reduce contract drift.
- As a core engineer, took a ground-up R&D concept through POC development to an NA and EU beta pilot, delivering a vehicle charging dashboard surfacing carbon intensity, solar production, and energy cost KPIs alongside historical session analytics to nudge EV charging behavior toward lower-cost and lower-emission windows.
- Built a management dashboard for a cloud vehicle inference platform, enabling teams to configure and deploy ML inference workloads and monitor their live log streams.
- Owned an end-to-end Kafka logging/analysis tool that extracted and deserialized DDS vehicle telemetry from a Bastion-only cluster, persisting structured inference logs to Azure Blob Storage to replace manual, ad-hoc debugging of a V2C pipeline.
- Implemented Cypress e2e tests as a Kubernetes CronJob with Slack alerting to catch regressions and validate service stability.
- Served as lead/sole frontend engineer across internal CRUD products, owning frontend system architecture for file ingestion and AI-assisted workflows and coordinating API contracts from prototype to production.

Software Engineer @ Rivian
November 2021 - October 2022 | Palo Alto, CA

- Shipped self-service permissions management for EDV fleet customers, replacing manual Rivian-assisted provisioning and enabling hundreds of fleet owners to independently manage user access and roles.
- Developed and deployed an Apollo Federated GraphQL subgraph using TypeGraphQL as a single source of truth for schema and resolvers, improving scalability and maintainability of vehicle service.
- Led identity management API migration to new major version in internal user management app, coordinating with teams for a smooth transition.
- Increased automated test coverage from ~70% to 95% with Jest/React Testing Library, improving release confidence and reducing regressions.

Software Engineer @ Codesmith
February 2021 - August 2021 | New York, NY

- Built and maintained internal tools and an online learning platform serving 150,000+ annual users, partnering with Content & Growth shareholders to ship e2e features.
- Refactored Express middleware to standardize SQL CRUD operations, reducing duplicated query logic and improving maintainability.
- Maintained a YAML-based content pipeline mapping plain-text updates to React components, enabling non-technical teammates to self-serve frequent website updates without engineering involvement.

SKILLS

JavaScript, TypeScript, Python, Node.js, FastAPI, Flask, Express, Pydantic, GraphQL, TypeGraphQL, Apollo Federation, PostgreSQL, MongoDB, OpenSearch/Elasticsearch, AWS, Docker, Kubernetes, Kafka, GitHub Actions, GitLab CI, React, React Native, Next.js, Tailwind, shadcn/ui, MUI, Jest, React Testing Library, Cypress, k6, Git, Figma

PUBLIC TALKS

Codesmith's Lecture Series

- Middleware Design Pattern
- Databases
- Authentication with Cookies and Sessions
- Linked Lists & Binary Search Trees
- Asynchronicity in JavaScript

SingleSprout Speaker Series

- State Management Alternatives

Codesmith's Intro to JavaScript

- Functions, Objects, and the Execution Context

PROJECTS

Constituent
Collaborated with a designer to build an iOS app empowering citizens to discover their representatives. Built using React Native, TypeScript, and a FastAPI Python backend.

next-persist
Built and open-sourced a lightweight Next.js utility that persists non-critical client state while remaining SSR/SSG-safe.

EDUCATION

B.Eng Mechanical Engineering
CUNY City College 2018

INTERESTS

Hosting bakery and pizza pop-ups, camping, volleyball, climbing
